Back to basics: multiply permutations Yang-Baxter elements The trace of the Yang-Baxter

Yang-Baxter elements are connected to the braid relation. Indeed, find the conditions on the unknowns to satisfy

$$(1+as_1)(1+bs_2)(1+cs_1) = (1+a's_2)(1+b's_1)(1+c's_2).$$
 (1)

Back to basics: multiply permutations Yang-Baxter elements The trace of the Yang-Baxter

Yang-Baxter elements are connected to the braid relation. Indeed, find the conditions on the unknowns to satisfy

$$(1+as_1)(1+bs_2)(1+cs_1) = (1+a's_2)(1+b's_1)(1+c's_2).$$
 (1)

We get six (redundant) equations that simplify into

$$b=b',$$
  $a=c',$   $c=a',$ 

and b = a + c.

Back to basics: multiply permutations! Yang-Baxter elements The trace of the Yang-Baxter

#### Let us define

$$Y_{s_i}(u,v) = Y_i(u,v) = 1 + (u-v)s_i.$$
 (2)

#### Then

$$Y_1(u, v) Y_2(u, w) Y_1(v, w) = Y_2(v, w) Y_1(u, w) Y_2(u, v).$$
(3)

Now, given a sequence of *spectral parameters* (historical reasons)  $\mathbf{u} = (u_1, \dots, u_n)$ , define

$$Y_{\sigma.s_i}(\mathbf{u}) = Y_{\sigma}(\mathbf{u})Y_i(u_{\sigma_i}, u_{\sigma_{i+1}}).$$
(4)

Then  $Y_{\sigma}$  is well-defined for any permutation  $\sigma$  written as a reduced product of elementary transpositions. Moreover, they form a basis of the symmetric group algebra (triangularity on the strong Bruhat order).

Back to basics: multiply permutations! Yang-Baxter elements The trace of the Yang-Baxter

Now define the *trace* that sends each permutation  $\sigma$  to  $p_{\lambda(\sigma)}$  where  $\lambda$  is its *cycle type*.

For example, our generic Yang-Baxter element is sent to

$$tr(Y_{321}(u, v, w)) = (1 + (u - v)(v - w))p_{111} + (u - w)(2 + (u - v)(v - w))p_{21} + (u - w)^2p_3.$$
(5)

which is also  $2 J_{111}$ , the Jack polynomial.

Ok, not impressive at all.

The case n=3 The general case

The recipe is very similar to get  $J_3$  and  $J_{21}$ :

$$tr(Y_{312}(u, v, w)) = p_{111} + (u + v - 2w)p_{21} + (u - w)(v - w)p_3,$$
  
which gives  $J_3 = p_{111} + 3ap_{21} + 2a^2p_3$  with  $u = 0, v = -a,$   
 $w = -2a.$ 

And

$$tr(Y_{231}(u, v, w)) = p_{111} + (2u - v - w)p_{21} + (u - v)(u - w)p_3,$$
  
which gives  $J_{21} = p_{111} + (a - 1)p_{21} - ap_3$  with  $u = 0, v = 1,$   
 $w = -a.$ 

ヘロト 人間 とくほ とくほ とう

æ.

The case n=3 The general case

The recipe is very similar to get  $J_3$  and  $J_{21}$ :

$$tr(Y_{312}(u, v, w)) = p_{111} + (u + v - 2w)p_{21} + (u - w)(v - w)p_3,$$
  
which gives  $J_3 = p_{111} + 3ap_{21} + 2a^2p_3$  with  $u = 0, v = -a,$   
 $w = -2a.$ 

And

$$tr(Y_{231}(u, v, w)) = p_{111} + (2u - v - w)p_{21} + (u - v)(u - w)p_3,$$

which gives  $J_{21} = p_{111} + (a - 1)p_{21} - ap_3$  with u = 0, v = 1, w = -a.

Still not very impressive.

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ = 臣 = のへで

The case n=3 The general case

We need two informations to compute a Yang-Baxter element: a permutation and a sequence of spectral parameters.

Given a partition  $\lambda$ , fill it with polynomials in *a* following this simple rule: the cell (r, c) is filled with (c - r.a). For example,

-3 <i>a</i>	1-3 <i>a</i>				
-2 <i>a</i>	1–2 <i>a</i>	2–2a	3 <i>—</i> 2 <i>a</i>		(7)
-a	1 <i>-a</i>	2- <i>a</i>	3 <i>–a</i>		(7)
0	1	2	3	4	

・ 同 ト ・ ヨ ト ・ ヨ ト … ヨ

and the sequence s(5, 4, 4, 2) is

0, 1, 2, 3, 4, -a, 1-a, 2-a, 3-a, -2a, 1-2a, 2-2a, 3-2a, -3a, 1-3a.

The case n=3 The general case

Now, about the permutation, write  $1, \ldots, n$  in rows from bottom to top and first read from right to left the cells with no values above them then read the remaining values by rows from right to left and from bottom to top.

For example,

14	15			_	
10	11	12	13		(8)
6	7	8	9		(0)
1	2	3	4	5	

and the permutation p(5, 4, 4, 2) is

5, 13, 12, 15, 14, 4, 3, 2, 1, 9, 8, 7, 6, 11, 10.

< 回 > < 回 > < 回 >
